TRADING STRATEGY BACKTEST REPORT

CASCADE S6 CRYPTO + STOCKS · three-slot portfolio · 10 November 2026

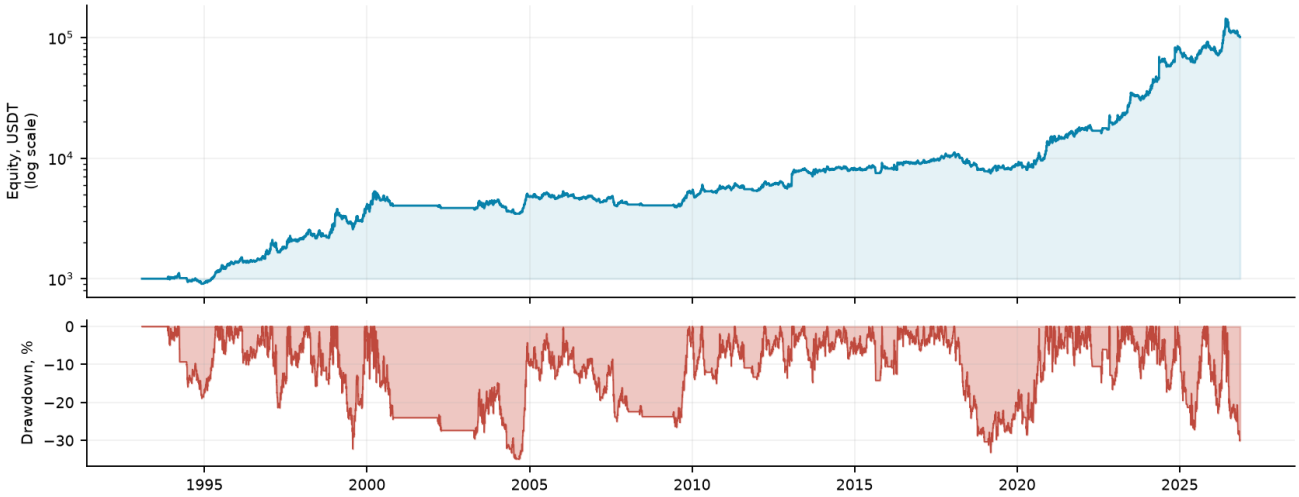

Market	Yahoo: stocks / ETFs and crypto	Instruments	Portfolio, 99 price series
Period	29 Jan 1993 – 09 Nov 2026	Timeframe	Daily candles
Portfolio days	12,338	Starting capital	1,000 USDT
Stop / sizing	8% of entry / volatility-based	Direction	Long only

1. Backtest results

Net profit	+9,999.20%	Profit factor	1.71
Win rate	41.02%	Max drawdown	-34.90%
Recovery factor	2.31	Sharpe (annual)	0.74
Sortino (annual)	1.21	Closed trades	729
Average win / loss	814.48 / -331.28 USDT	Longest recovery	3,536 calendar days
Average trade duration	28.9 calendar days	Total commissions	7,913.46 USDT

Final equity: **100,992.02 USDT**, including two open positions. Profits are reinvested; hypothetical future exit commissions on those positions are not deducted.

2. Equity curve and drawdown

Top: daily portfolio equity on a logarithmic scale. Bottom: decline from the previous equity peak. These are not actual exchange trading results.

3. YEAR-BY-YEAR RESULTS

Full breakdown of portfolio performance. N is the number of closed trades. Trades and profit factor are attributed to the year in which trades closed; annual return includes mark-to-market changes in open positions. Annual max drawdown is measured from the local peak, including equity at the start of the year.

Year	N	PF	Net	Max DD	Year	N	PF	Net	Max DD
1993*	3	0.18	+0.3%	-5.0%	2010	20	1.42	+7.7%	-15.0%
1994	14	0.62	-7.4%	-18.9%	2011	16	0.75	-5.5%	-13.9%
1995	15	4.50	+48.0%	-7.3%	2012	18	1.11	+9.4%	-13.6%
1996	19	1.71	+18.3%	-10.1%	2013	24	2.54	+35.1%	-14.8%
1997	25	2.46	+33.7%	-21.4%	2014	17	1.32	+4.7%	-8.5%
1998	19	1.24	+25.2%	-15.8%	2015	23	1.19	+0.3%	-14.2%
1999	22	1.92	+52.5%	-32.2%	2016	23	1.39	+8.0%	-9.3%
2000	29	1.60	-2.7%	-24.4%	2017	19	2.08	+16.5%	-7.2%
2001	0	—	+0.0%	0.0%	2018	41	0.50	-25.6%	-30.3%
2002	4	0.00	-4.4%	-5.6%	2019	24	1.07	+13.3%	-9.5%
2003	17	1.42	+14.1%	-13.5%	2020	41	1.97	+51.0%	-14.2%
2004	24	1.74	+9.4%	-23.6%	2021	33	2.82	+32.7%	-11.9%
2005	23	0.73	-0.9%	-12.2%	2022	27	1.47	+10.2%	-16.6%
2006	19	1.05	-3.3%	-14.7%	2023	31	2.46	+81.0%	-13.7%
2007	19	0.65	-8.0%	-18.0%	2024	35	3.48	+126.0%	-17.2%
2008	4	0.13	-4.6%	-4.6%	2025	36	1.22	+0.8%	-23.1%
2009	10	9.63	+29.6%	-5.3%	2026*	35	1.38	+25.8%	-30.1%

* 1993 and 2026 are partial calendar years; “—” means there were no closed trades. Annual return can differ from the total profit on trades closed during that year because the unrealized value of open positions changes.

4. Trading costs

Item	Assumption applied
Commission	0.10% of notional on each entry and exit; 7,913.46 USDT in total, including entry fees on open positions.
Slippage and spread	Not included. Intraday stop fills are modeled at the stop price; gaps are filled at the open.
Funding	Not applicable to this spot-portfolio model.
Other costs	Dividends, taxes, market impact and exchange constraints are not included.

5. Out-of-sample testing

No separate out-of-sample test was conducted. Parameters and stated fixes in the original code are already linked to previous historical research, so no part of this result is presented as an independent validation.

6. METHODOLOGY AND LIMITATIONS

Data and execution

• **Data:** Yahoo Finance — 80 underlying stocks/ETFs and 19 cryptocurrency pairs. Stock and ETF histories are proxies for tokenized assets; USD is used as a proxy for USDT. Before the launch of rTokens this test is entirely hypothetical. The Bitget spot instruments, their liquidity and price correspondence were not verified.

• **Strategy implementation:** the strategy was reproduced in a separate simulator using closed daily bars rather than running the supplied module directly. Signals are executed at the next available open; intraday stop touches are filled at the stop price and gaps at the open. New signals are prioritized alphabetically; a maximum of two entries per day and three positions are allowed; DCA is disabled.

• **Calendars and timing:** Yahoo stock data has no weekend candles, while crypto trades continuously. The daily model processes market opens as a single batch and does not reproduce the actual sequence of different markets opening. This can create timing inconsistencies and change the result.

• **Formulas:** the EMA components of ADX and RSI were calculated over all available past history rather than recalculated from the latest 320 bars at every point. This may cause small differences from the supplied module. The 252-day volatility calculation requires at least 253 prices.

• **Missing data:** empty and invalid OHLC bars were discarded. In the data snapshot used for this test, Yahoo returned an empty daily bar for 9 November 2026 for all 19 cryptocurrencies; the latest usable bar was 8 November. No trade execution was simulated for an instrument on a day without a candle.

• **Retrospective universe:** the whitelist embedded in the current code was applied to historical dates without reconstructing listings and delistings as they stood at the time. This introduces substantial survivorship and selection bias. The historical external stocks_whitelist.py file was not obtained.

Metric definitions

Net profit is the change in equity from 1,000 USDT; profit factor and win rate use closed trades only. Sharpe is mean calendar-day return divided by its sample standard deviation, multiplied by √365; the risk-free rate is 0%. Sortino uses the same numerator divided by the square root of the mean squared negative daily returns, multiplied by √365. Recovery factor = net profit / maximum absolute drawdown (43,306.62 USDT); the largest absolute and percentage drawdowns can occur in different periods. Longest recovery: 2000-03-27 to 2009-12-01, 3,536 calendar days, recovered.
